

Press Release

GC FUJI® BULK – not your ordinary glass ionomer cement!

As a restorative material, the biggest challenge for a GIC is being able to protect the surrounding and adjacent tooth structures while being robust enough to maintain its own form and function in acidic oral environments. Now, GC takes yet another step into the future of modern restorative therapy by presenting **FUJI® BULK**, the most acid-resistant conventional GIC.

FUJI® BULK is a **robust, rapid-setting, multipurpose** auto-cure GIC designed to meet the challenge of bulk placed restorations in more acidic oral environments. Truly remarkable in its formulation, Fuji BULK provides a unique balance between restoring function and protecting tooth surfaces from acid challenges.

FUJI® BULK is the perfect choice for restorations where **speed, acid resistance**, and **bulk cure** are priorities over aesthetics:

- Paediatrics
- Geriatrics
- Special needs patient
- Dry mouth patients
- Transitional restorations
- Caries-active patients
- Patients with erosion
- Exposed root surfaces

As a global dental manufacturer, GC always strive to develop products that live up to the reputation of "GC, the Leader in Quality" and **FUJI® BULK** is another innovative quality product that will satisfy customer needs.
