AESTHETIC IS THE RESULT

IDEM 2018 PRESS RELEASE HELMUT ZEPF MEDIZINTECHNIK GMBH

Benex® Extraction System

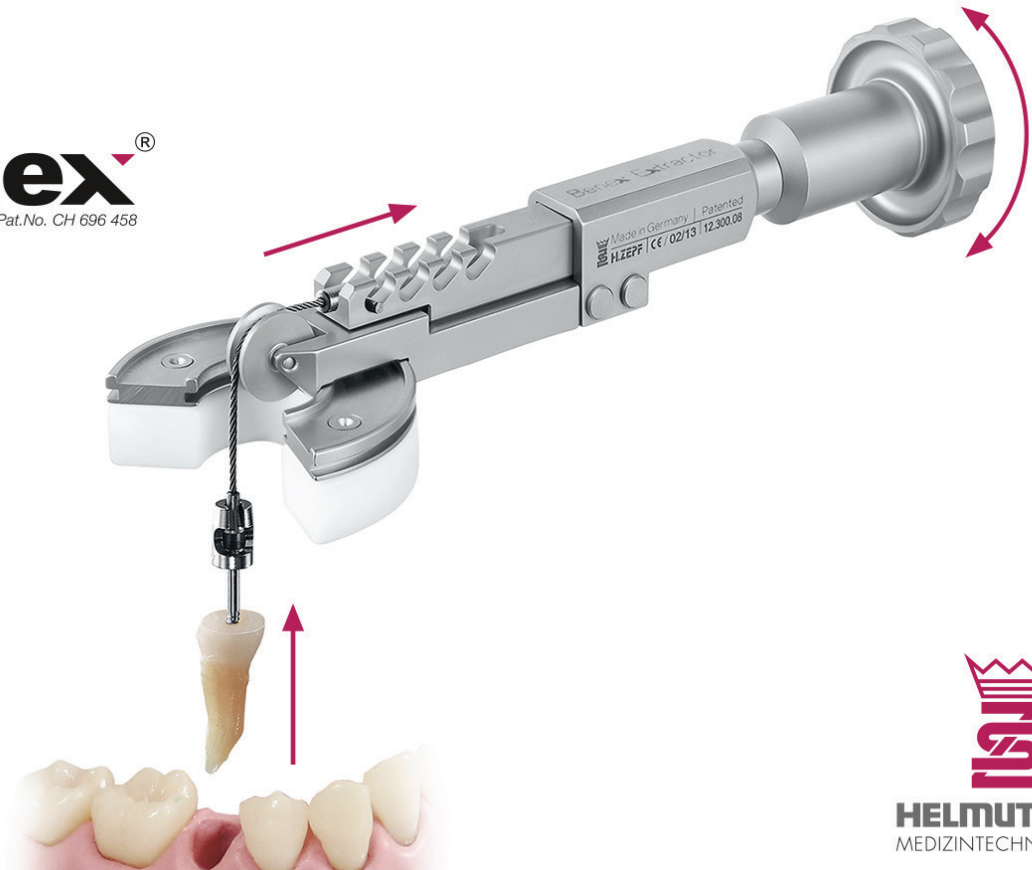

In modern dental treatment, implantology following extraction is increasingly favoured. Consistent with the principle of minimal invasion, conserving soft and hard tissue structures is a must. Starting with extraction. The modified Benex® guarantees a gentle and simple extraction of roots in the whole mouth. It is nearly impossible to harm the soft tissue and the surrounding bone. Due to the longitudinal extraction, Benex® is an optimal basis for direct implantation. It is also a valuable help for implantation at a later stage after the extraction with the Benex® System. Studies made after the use of the Benex® System prove that the reossification of the extraction alveolus is advancing optimally. This is a great advantage for the retarded implantation.

New studies recently report, that surgical extrusion using the Benex® Extraction System causes fewer complications compared with previous extrusion procedures.
